Chapter 1

Topological Spaces and Continuous Functions.

1.1 Topological Spaces.

Definition. A topology on a set X is a collection \mathcal{T} of subsets of X such that:

- (1) $\emptyset, X \in \mathcal{T}$.
- (2) For any subcollection $\{U_{\alpha}\}$ of subsets of X, $\bigcup_{\alpha} U_{\alpha} \in \mathcal{T}$.
- (3) For any finite subcollection $\{U_i\}_{i=1}^n$ of subsets of X, $\bigcap_{i=1}^n U_i \in \mathcal{T}$.

We call the pair (X, \mathcal{T}) a **topological space**, and we call the elements of \mathcal{T} open sets.

- **Example 1.1.** (1) Let X be any set, the collection of all subsets of X, 2^X is a topology on X, which we call the **discrete topology**. We call the topology $\mathcal{T} = \{\emptyset, X\}$ the **indiscrete topology**.
 - (2) Let X be any set, and let $\mathcal{T}_f = \{U \subseteq X : X \setminus U \text{ is finite, or } X \setminus U = X\}$. Then \mathcal{T}_f is a topology and called the **finite complement topology**.
 - (3) Let X be any set, and let $\mathcal{T}_c = \{U \subseteq X : X \setminus U \text{ is countable, or } X \setminus U = X\}$. Then \mathcal{T}_c is a topology on X.

Definition. Let X be a set, and let \mathcal{T} and \mathcal{T}' be topologies on X. We say that \mathcal{T} is **coarser** than \mathcal{T}' , and \mathcal{T}' finer than \mathcal{T} if $\mathcal{T} \subseteq \mathcal{T}'$. If two topologies are either coarser, or finer than each other, we call them **comparable**.

Example 1.2. The topologies \mathcal{T}_f and \mathcal{T}_c are comparable, and we see that $\mathcal{T}_f \subseteq \mathcal{T}_f$, so \mathcal{T}_f is coarser than \mathcal{T}_c , and \mathcal{T}_c is finer than \mathcal{T}_f .

1.2 The Basis and Subbasis for a Topology.
